Sr>Ca>Mg>Be Atomic radii increase going down a group, because successively larger valence-shell orbitals are occupied by electrons. For example, strontium has electrons in the fifth shell, which contains much larger orbitals than the fourth, third, second, or first shells.

The magnitude of the heat (change) is therefore the same for both substances, and the negative sign merely shows that q substance M and q substance W are opposite in direction of heat flow (gain or loss) but does not indicate the arithmetic sign of either q value (that is determined by whether the matter in question gains or loses heat, per definition).
