The new CLSI breakpoints simplify susceptibility testing by obviating the need for extended-spectrum beta-lactamase (ESBL) testing, (i.e., testing isolates using cefotaxime and ceftazidime, with and without the beta-lactamase inhibitor, clavulanic acid) to enhance the detection of strains with low-level cephalosporin resistance.

Period B was originally interpreted according to EUCAST 1.3 guidelines. In order to analyze whether or not changes in susceptibility rates over time were due to the guideline change alone, results of period B were reinterpreted according to CLSI 2009 guidelines. Additionally, period B was reinterpreted according to CLSI 2013 and EUCAST 3.1.

The purpose of this review is to provide the rationale for the development of the new Clinical and Laboratory Standards Institute (CLSI; formerly the NCCLS) guidelines on antimicrobial susceptibility testing of infrequently encountered or fastidious bacteria.

New Consensus Guidelines from the Clinical and Laboratory ...
Introduction. Implementation of the breakpoints established in the European Committee on Antimicrobial Susceptibility Testing (EUCAST) guidelines in comparison with those of the Clinical and Laboratory Standards Institute (CLSI) means that the criteria for interpreting the susceptibility of some antimicrobials have been modified,
resulting in changes in the reports of accumulated antibiotic ...

Clinical breakpoints - fungi (Candida and Aspergillus) What to do when there are no clinical breakpoints! Guidance from EUCAST (last edited 2016) In the 2019 breakpoint table we highlight the following new/changed items: New breakpoints for meropenem-vaborbactam and eravacycline. Several updates due to taxonomy changes.

After more than 50 years, disc diffusion is still a widely used procedure for antimicrobial susceptibility testing (AST) in the clinical microbiological laboratory. National and international
guidelines refer to standardized Kirby-Bauer testing, e.g. CLSI or European Committee on AST (EUCAST) guidelines for AST 2, 3.
