Ultrasound Guided Regional Nerve Block by LPI Media

**Ultrasound Guided Regional Nerve Block**
A high-frequency linear ultrasound transducer is recommended for most ultrasound-guided nerve blocks. Additionally, the operator will need a long needle such as a commercially available nerve block needle or, if these are not available, a spinal needle.

Emergency physician performed ultrasound-guided regional anesthesia is an evolving field that offers many potential benefits in the emergency setting: Analgesia can be targeted specifically to the region of pain and provide relief for many hours, large volumes of local anesthetic can be avoided and there is also less need for general sedation without the increased morbidity to patients.

Ultrasound-guided nerve blocks were first described in anesthesiology literature in 1978, when La Grange et al. utilized a Doppler device while performing supraclavicular brachial plexus blocks. As ultrasound technology matured over the following two decades, researchers in anesthesiology refocused their attention on this technique.
